(Preview of) Midterm Exam No. 02 (Fall 2019) PHYS 500A: Mathematical Methods

Date: 2019 Oct 29

- 1. (20 points.) On contour integrals with poles.
- 2. (20 points.) Consider the integral

$$I(\theta) = \frac{1}{\pi} \int_0^\infty \frac{x^{\frac{1}{2}} dx}{1 + 2x \cos \theta + x^2},$$
(1)

where $0 \le \theta < 2\pi$ is real. To evaluate $I(\theta)$ let us consider the following integral on the complex plane

$$G(\theta) = \frac{1}{\pi} \oint_c \frac{z^{\frac{1}{2}} dz}{1 + 2z \cos \theta + z^2},$$
(2)

where the contour c is described in Figure 1.

Figure 1: Contour $c = c_1 + c_2 + c_3 + c_4$. The radii of the contours c_2 and c_4 are R and ϵ , respectively, and contours c_1 and c_3 are δ away from the real line. We assume limits $\epsilon \to 0$, $R \to \infty$, and $\delta \to 0$.

(a) Show that

$$1 + 2z\cos\theta + z^2 = (z + e^{i\theta})(z + e^{-i\theta})$$
(3)

and identify the poles. Show that the integrand has a branch point at z = 0. Choose the branch cut to be the positive real line. Using Cauchy's theorem show that

$$G(\theta) = 2 \frac{\sin \frac{\theta}{2}}{\sin \theta}.$$
(4)

- (b) Next, let us evaluate $G(\theta)$ by evaluating the integrals on the contour explicitly.
 - i. For the part of contour constituting c_1 substitute $z = xe^{i\delta} \sim x + i\delta'$ and show that

$$\lim_{\delta \to 0} \lim_{\epsilon \to 0} \lim_{R \to \infty} \frac{1}{\pi} \oint_{c_1} \frac{z^{\frac{1}{2}} dz}{(z + e^{i\theta})(z + e^{-i\theta})} = I(\theta).$$
(5)

ii. For the part of contour constituting c_3 substitute $z = xe^{i(2\pi-\delta)} \sim x - i\delta'$ and show that

$$\lim_{\delta \to 0} \lim_{\epsilon \to 0} \lim_{R \to \infty} \frac{1}{\pi} \oint_{c_3} \frac{z^{\frac{1}{2}} dz}{(z+e^{i\theta})(z+e^{-i\theta})} = -e^{i\frac{2\pi}{2}} I(\theta) = I(\theta).$$
(6)

iii. For the part of contour constituting c_2 substitute $z = Re^{i\theta}$ and show that

$$\lim_{R \to \infty} \frac{1}{\pi} \oint_{c_2} \frac{z^{\frac{1}{2}} dz}{(z + e^{i\theta})(z + e^{-i\theta})} = 0.$$
(7)

iv. For the part of contour constituting c_4 substitute $z = \epsilon e^{i\theta}$ and show that

$$\lim_{\epsilon \to 0} \frac{1}{\pi} \oint_{c_2} \frac{z^{\frac{1}{2}} dz}{(z + e^{i\theta})(z + e^{-i\theta})} = 0.$$
(8)

(c) Together, conclude that

$$2\frac{\sin\frac{\theta}{2}}{\sin\theta} = I(\theta) + 0 + I(\theta) + 0.$$
(9)

Thus, evaluate $I(\theta)$.

- 3. (20 points.) On damped harmonic oscillator.
- 4. (20 points.) Read the article titled 'Life at low Reynolds number' by E. M. Purcell, American Journal of Physics 45 (1977) 3. Here is the link to the article:

http://dx.doi.org/10.1119/1.10903

One question will be asked to verify the understanding of the concept being discussed in the paper.
